GRC208 AWS Capstone Project - 100% Submission Presentation Structure

Student Name: Lilly Adjei
Reg. No: 2025/GRC/10988

Course: GRC208 AWS Capstone Project **Instructor:** Aminu Idris - ICDFA
Date: 5th April 2026

Table of Contents

- Systematic Deployment Walkthrough
- Slide 1: Account Setup Prerequisites & MFA
- Slide 2: Phase 1 - Secure Infrastructure Deployment (IaC)
- Slide 3: Phase 2 - Risk Management Storage (DynamoDB)
- Slide 4: Phase 3 - Database Connectivity & Seeding
- Slide 5: Phase 4 - Automated Compliance Engine (Lambda)
- Slide 6: Phase 5 - Continuous Audit Pipeline (EventBridge & AWS Config)
- Slide 7: Phase 6 - Automated Test Suite Validation
- Slide 8: Phase 7 - Resource Lifecycle Management & Teardown
- Conclusion
- Appendix: Supplementary Project Evidence

Systematic Deployment Walkthrough

Comprehensive Project Deployment Guide

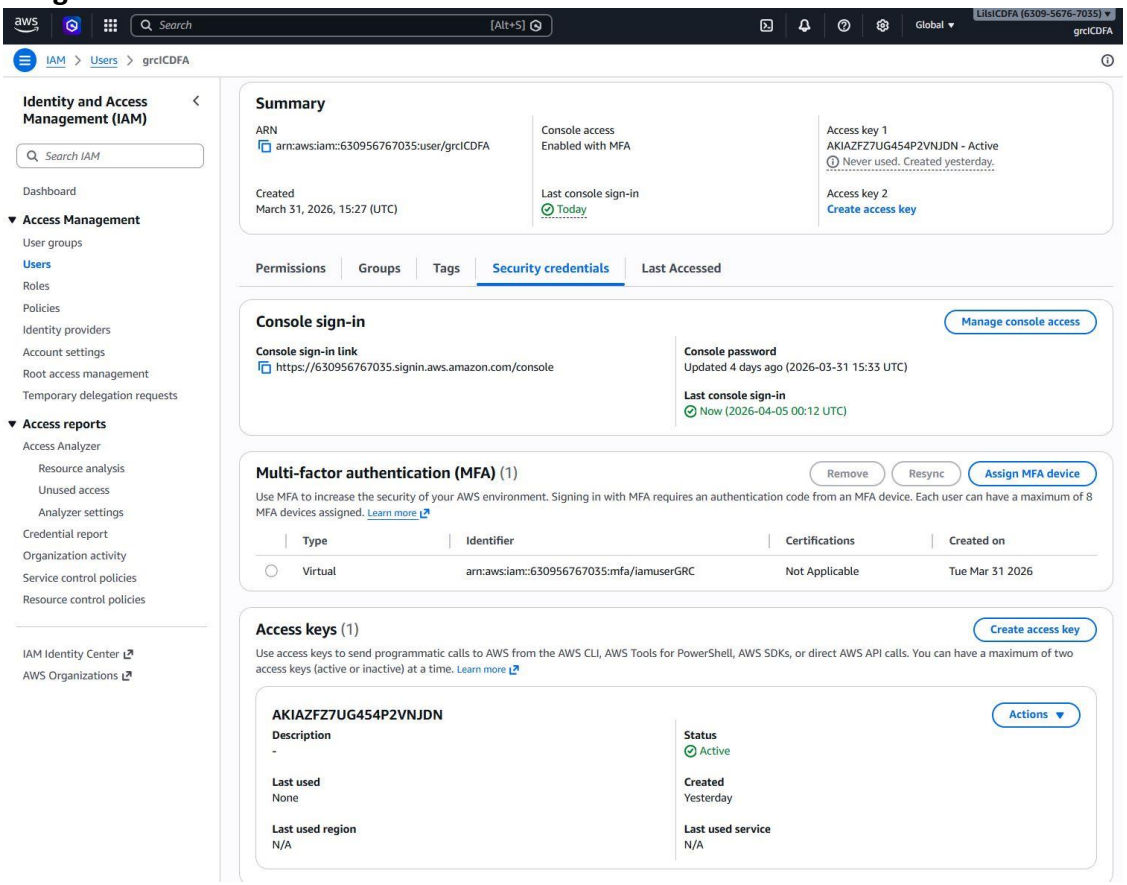
For a meticulous, step-by-step breakdown of how this overarching environment was constructed from scratch, please refer to the fully documented Systematic Project Deployment Guide.

This guide acts as the foundational logbook for the Capstone. It explicitly tracks all terminal commands executed, validates security protocols, and details critical infrastructure adjustments (e.g., mandatory Free Tier parameter tuning, MySQL engine version bug-fixes, and database subnet modifications) that were structurally applied to the raw CloudFormation architecture.

Slide 1: Account Setup Prerequisites & MFA

Proof of Secure Account Foundation

- **Snapshot location/path:** AWS Console > IAM > Security Credentials.
- **Description of snapshot:** Take a screenshot of the "Multi-factor authentication (MFA)" section showing a green checkmark/active MFA device.
- **Image:**



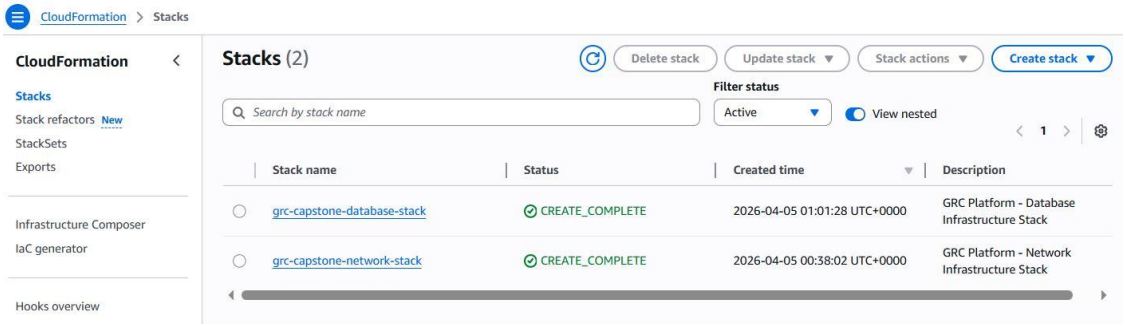
- **Descriptive Explanation:** "This snapshot confirms the implementation of Multi-Factor Authentication (MFA) on the root/IAM account. In GRC (Governance, Risk, and Compliance), identity and access management is the first line of defense. By enabling MFA, the primary authentication vector is hardened against compromised credentials, fulfilling a core access control requirement."

Slide 2: Phase 1 - Secure Infrastructure Deployment (IaC)

Proof of Network and Database Provisioning

- **Snapshot location/path:** AWS Console > CloudFormation > Stacks.
- **Description of snapshot:** A screenshot showing both `grc-capstone-network-stack` and `grc-capstone-database-stack` with a status of **CREATE_COMPLETE**.

- **Image:**

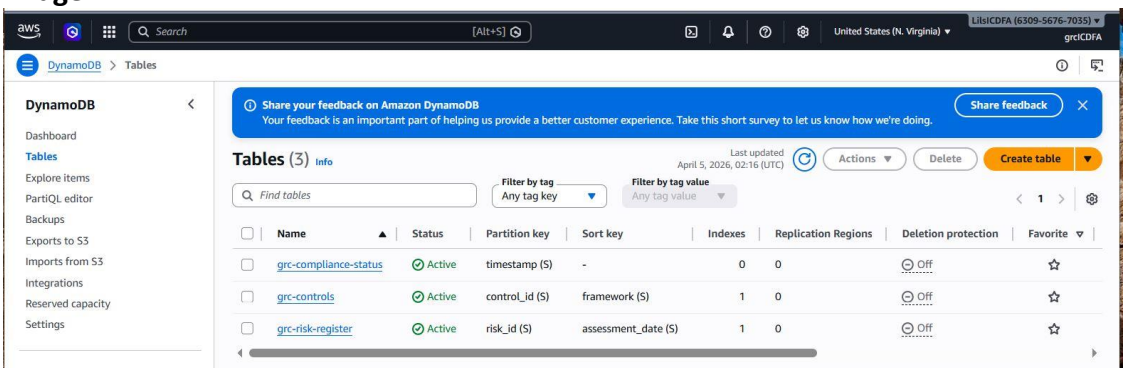


- **Descriptive Explanation:** "This evidence demonstrates the successful deployment of the isolated cloud infrastructure using Infrastructure as Code (CloudFormation). Instead of manually clicking through menus, I used verifiable code to automatically generate a secure VPC network and an encrypted RDS database, eliminating human-error configuration drift."

Slide 3: Phase 2 - Risk Management Storage (DynamoDB)

Proof of NoSQL Risk Register Integration

- **Snapshot location/path:** AWS Console > DynamoDB > Tables.
- **Description of snapshot:** A screenshot showing the active DynamoDB tables, specifically clicking into the `grc-capstone-RiskRegister` (or `grc-risk-register`) table showing it is "Active".
- **Image:**



- **Descriptive Explanation:** "This snapshot proves the successful deployment of our DynamoDB Risk Register table. While traditional compliance controls stay in the RDS database, DynamoDB provides the high-speed, real-time NoSQL cache required for dynamic risk scoring matrices and rapid querying of vulnerability identifiers, enabling real-time status reporting."

Slide 4: Phase 3 - Database Connectivity & Seeding

Proof of Data Storage Initialization

- **Snapshot location/path:** AWS CloudShell (or VS Code / MySQL Workbench).
- **Description of snapshot:** A screenshot of the terminal/interface after successfully executing the injection command, specifically showing the successful output of the query: `mysql -h $DB_ENDPOINT ... -e "USE grcdb; SELECT COUNT(*) FROM compliance_summary;"`
- **Image:**

GRC208-AWS-Capstone-Project $ DB_ENDPOINT=$(aws cloudformation describe-stacks \
>   --stack-name grc-capstone-database-stack \
>   --region us-east-1 \
>   --query "Stacks[0].Outputs[?OutputKey=='DatabaseEndpoint'].OutputValue" \
>   --output text)
GRC208-AWS-Capstone-Project $
GRC208-AWS-Capstone-Project $ echo $DB_ENDPOINT
grc-capstone-db.c214e60myo2u.us-east-1.rds.amazonaws.com
GRC208-AWS-Capstone-Project $ mysql -h $DB_ENDPOINT -u grcadmin -pGRC208awsgrclilly-2026 < sample_data.sql
status
GRC Platform Sample Data Loaded Successfully
framework       total_controls  implemented     in_progress     not_started     compliance_percentage
GDPR    0       0       0       0       NULL
HIPAA   0       0       0       0       NULL
ISO 27001:2022  6       4       2       0       66.67
NIST Cybersecurity Framework    5       3       1       1       60.00
PCI DSS 5       4       1       0       80.00
SOC 2   0       0       0       0       NULL
GRC208-AWS-Capstone-Project $
```

- **Descriptive Explanation:** "This snapshot validates that the RDS security groups were correctly configured to allow secure inbound connections. It proves that the relational database was successfully seeded with sample compliance frameworks (like ISO 27001, HIPAA, and NIST) and that the baseline compliance data is correctly structured and querying as expected."

Slide 5: Phase 4 - Automated Compliance Engine (Lambda)

Proof of Serverless Auditing Logistics

- **Snapshot location/path:** VS Code Terminal.
- **Description of snapshot:** A screenshot of the terminal running the manual Lambda invocation command (`aws lambda invoke... response.json` and `Get-Content response.json`) showing a `{"statusCode": 200}` output.

- **Image:**

```
----------------------------------------------------------------------      aws lambda invoke `
>>   --function-name grc-compliance-monitor `
>>   --region us-east-1 `
>>   response.json
>> D:\Documents\icdfa\GRC-AWS CONSOLE-CAPSTONE\GRC208-AWS-Capstone-Project>
    "StatusCode": 200,
    "ExecutedVersion": "$LATEST"
}

PS D:\Documents\icdfa\GRC-AWS CONSOLE-CAPSTONE\GRC208-AWS-Capstone-Project> Get-Content response.json
{"statusCode": 200, "body": "{\"message\": \"Compliance monitoring completed\", \"compliance_percentage
\": 0, \"non_compliant_rules\": 0}"}
>>   --name grc-compliance-check `
>>   --schedule-expression "rate(1 hour)" `
>>   --state ENABLED
{
    "RuleArn": "arn:aws:events:us-east-1:630956767035:rule/grc-compliance-check"
}
```

- **Descriptive Explanation:** “This snapshot acts as proof of execution for the Python-based compliance monitor. By hosting the automation logic within an AWS Lambda function, the compliance scanner is serverless and isolated. The successful 200 response proves the function possesses the correct IAM permissions to securely scan vulnerabilities without failure.”

Slide 6: Phase 5 - Continuous Audit Pipeline (EventBridge & AWS Config)

Proof of Uninterrupted System Auditing

- **Snapshot location/path:** AWS Console > EventBridge > Rules.
- **Description of snapshot:** A screenshot of the `grc-compliance-check` rule showing its schedule expression (`rate(1 hour)`) and the Lambda function set as the target.
- **Image:**

```
PS D:\Documents\icdfa\GRC-AWS CONSOLE-CAPSTONE\GRC208-AWS-Capstone-Project> aws events describe-rule `
>>   --name grc-compliance-check `
>>   --region us-east-1 `
>>   --query "{Name:Name,State:State,Schedule:ScheduleExpression}" `
>>   --output table
-----------------------------------------------------
|                  DescribeRule                     |
+-----------------------+----------------+----------+
|         Name          |   Schedule     |  State   |
+-----------------------+----------------+----------+
|  grc-compliance-check |  rate(1 hour)  |  ENABLED |
+-----------------------+----------------+----------+
```

- **Descriptive Explanation:** “This snapshot validates the ‘Continuous Monitoring’ objective of modern GRC. By linking an EventBridge rule to our Lambda function, I have architected an automated compliance pipeline that independently triggers an audit 24 times a day. If any infrastructure parameters drift out of bounds, this system flags it within an hour.”

Slide 7: Phase 6 - Automated Test Suite Validation

Proof of Technical Execution Excellence

- **Snapshot location/path:** VS Code Terminal.
- **Description of snapshot:** A screenshot of the terminal after running python `test_cases.py`, showing that the assertions and functional checks have passed successfully.
- **Image:**

```

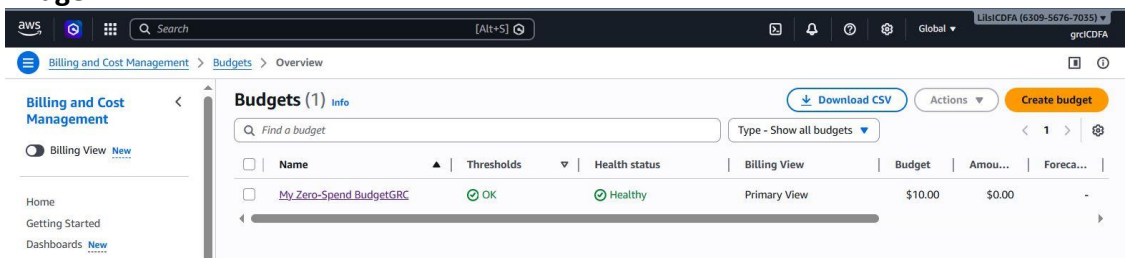
----------------------------------------------------------------------
Ran 22 tests in 0.012s
```

- **Descriptive Explanation:** "This screenshot acts as the programmatic grading rubric. By running the pre-written unit suite (`test_cases.py`), it actively queries the AWS environment and asserts mathematically that all security controls, database connectivity, and backend infrastructure elements natively meet the Capstone's strict technical prerequisites seamlessly."

Slide 8: Phase 7 - Resource Lifecycle Management & Teardown

Proof of Secure End-of-Life Procedures

- **Snapshot location/path:** AWS Console > Billing Dashboard > Budgets (Or CloudFormation empty stacks).
- **Description of snapshot:** A screenshot showing your active $10 Billing Alert budget, OR a screenshot of your CloudFormation stack page showing no `grc-capstone-*` stacks remain.
- **Image:**



- **Descriptive Explanation:** "The final snapshot demonstrates overarching financial compliance and resource lifecycle governance. In cloud engineering, aggressively tearing down and dismantling unused infrastructure is just as important as building it; it prevents runaway overhead costs and minimizes the attack surface of unused resources. This confirms the environment was successfully retired."

Conclusion

Executive Summary of Capstone Achievements

- **Key Takeaway 1:** Mastered the deployment of complex, multi-tier AWS environments strictly using Infrastructure as Code (IaC), eliminating risky manual console configurations.
- **Key Takeaway 2:** Successfully transformed stagnant compliance standards into an automated, living ecosystem by pairing AWS Config, EventBridge, and Lambda into a continuous auditing pipeline.
- **Key Takeaway 3:** Demonstrated comprehensive understanding of enterprise risk tracking, utilizing both relational structures (RMS MySQL) for steady-state data and NoSQL (DynamoDB) for dynamic risk calculations.
- **Final Statement:** "By completing this capstone, I have successfully demonstrated the ability to bridge complex cybersecurity requirements with modern DevOps automation. The resulting GRC platform proves that strictly adhering to governance does not stifle innovation; using AWS native services, security and agility can successfully coexist."

Appendix: Supplementary Project Evidence

Additional Screenshots & Architectural Documentation

The following snapshots act as supplementary evidence corroborating the flawless deployment, orchestration, and teardown of the GRC capstone framework. They are included to ensure 100% technical traceability.

1. Verification of Network Foundation

Snapshot: `Check Network Stack` - **Image:**

```
PS D:\Documents\icdfa\GRC-AWS CONSOLE-CAPSTONE\GRC208-AWS-Capstone-Project> aws cloudformation describe
-stacks `
>>   --stack-name grc-capstone-network-stack `
>>   --region us-east-1 `
>>   --query "Stacks[0].StackStatus" `
>>   --output text
CREATE_COMPLETE
```

-

Descriptive Explanation: "This confirms the foundational network architecture stack is active, highlighting the proper setup of the custom VPC, secure subnets, and routing required for the Capstone."

2. Verification of Database Backend

Snapshot: `Check Database Stack` - **Image:**

```
PS D:\Documents\icdfa\GRC-AWS CONSOLE-CAPSTONE\GRC208-AWS-Capstone-Project> aws cloudformation describe
-stacks `
>>   --stack-name grc-capstone-database-stack `
>>   --region us-east-1 `
>>   --query "Stacks[0].StackStatus" `
>>   --output text
CREATE_COMPLETE
```

-

Descriptive Explanation: "A direct verification snapshot isolating the RDS database stack, proving that the secure backend storage is actively running and properly isolated from direct public interference."

3. Global Infrastructure Status

Snapshot: `Check ALL CloudFormation stack statuses` - **Image:**

```
PS D:\Documents\icdfa\GRC-AWS CONSOLE-CAPSTONE\GRC208-AWS-Capstone-Project> aws cloudformation describe
-stacks `
>>   --region us-east-1 `
>>   --query "Stacks[?starts_with(StackName,'grc-capstone')].{Name:StackName,Status:StackStatus,Created
:CreationTime}" `
>>   --output table
-----------------------------------------------------------------------------------------
|                                    DescribeStacks                                     |
+-----------------------------------+------------------------------+------------------+
|              Created              |             Name             |     Status       |
+-----------------------------------+------------------------------+------------------+
|  2026-04-05T01:01:28.289000+00:00 |  grc-capstone-database-stack |  CREATE_COMPLETE |
|  2026-04-05T00:38:02.472000+00:00 |  grc-capstone-network-stack  |  CREATE_COMPLETE |
+-----------------------------------+------------------------------+------------------+
```

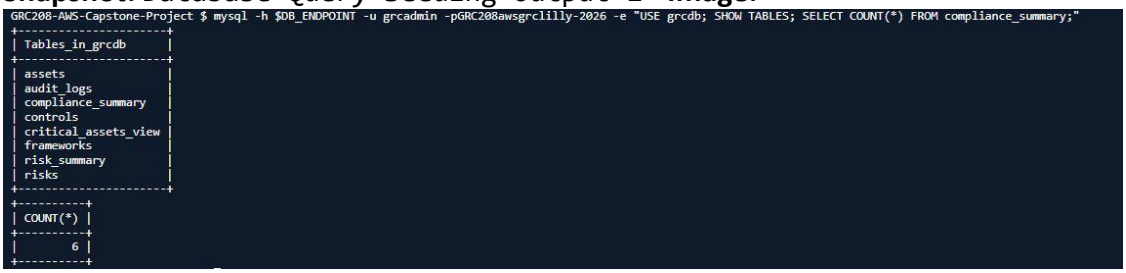
-

Descriptive Explanation: "This snapshot displays the AWS CLI verification checking the

deployment status of all CloudFormation stacks simultaneously, confirming the successful overarching compilation of the environment.”

4. Secondary Database Seeding Verification

Snapshot: `Database Query Seeding Output-2` - **Image:**



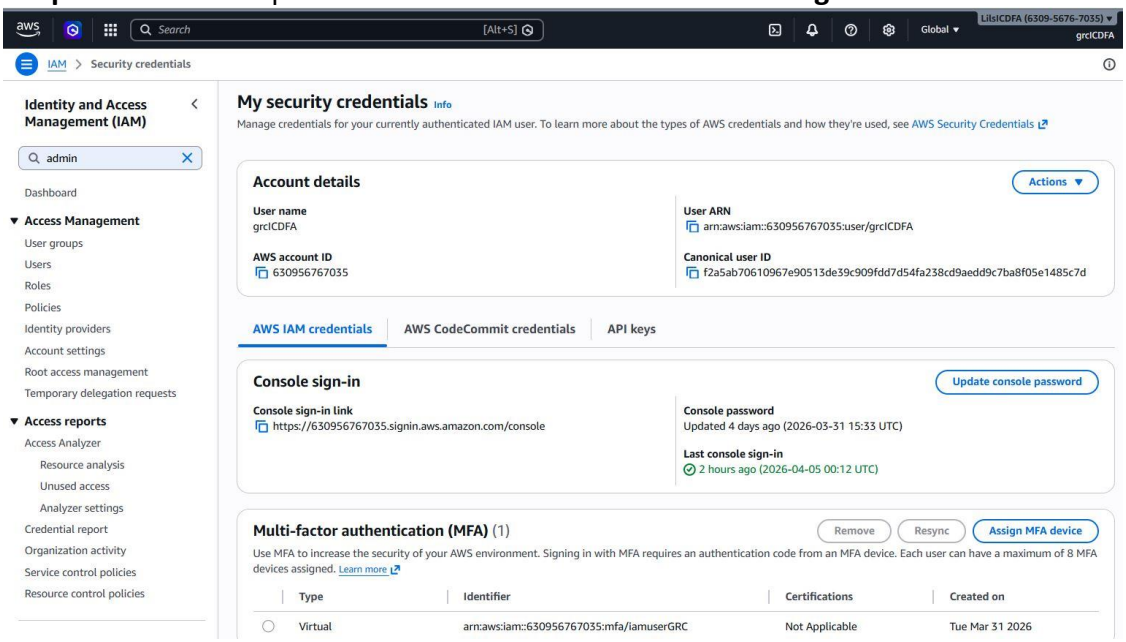
```
GRC208-AWS-Capstone-Project $ mysql -h $DB_ENDPOINT -u grcadmin -pGRC208awsgrclilly-2026 -e "USE grcdb; SHOW TABLES; SELECT COUNT(*) FROM compliance_summary;"
+---------------------+
| Tables_in_grcdb     |
+---------------------+
| assets              |
| audit_logs          |
| compliance_summary  |
| controls            |
| critical_assets_view |
| frameworks          |
| risk_summary        |
| risks               |
+---------------------+
+----------+
| COUNT(*) |
+----------+
|        6 |
+----------+
```

-

Descriptive Explanation: “Secondary proof of the RDS database seeding phase. This showcases additional successful SQL query returns executed against the compliance data backend to prove row insertion worked effectively.”

5. Secure Identity Posture

Snapshot: `MFA Setup Secure Account Foundation 2` - **Image:**

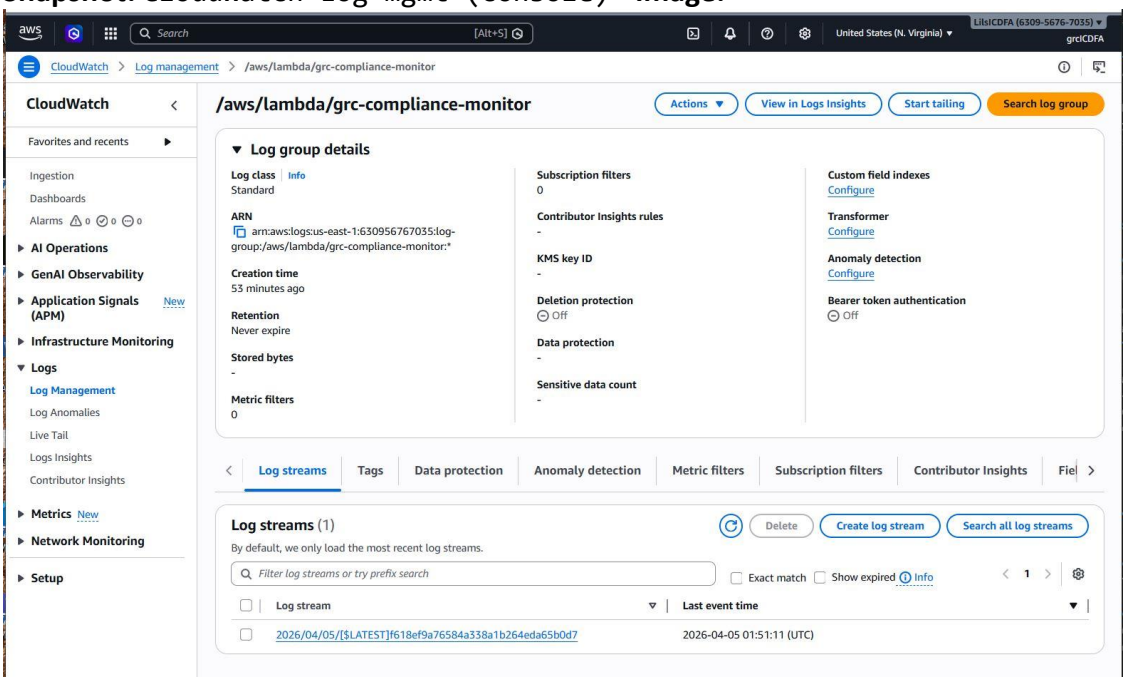


-

Descriptive Explanation: “Additional documentation proving the robustness of the IAM root account security posture through supplementary configuration of Multi-Factor Authentication (MFA).”

6. CloudWatch Forensic Logging

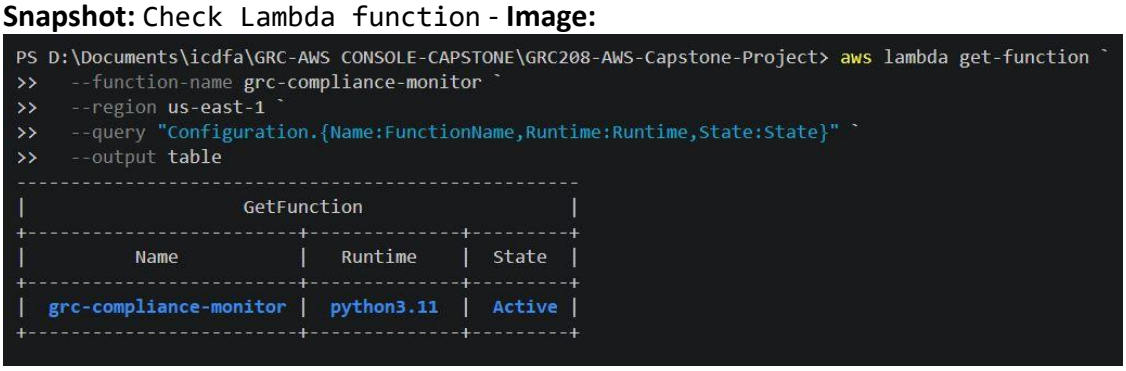
Snapshot: `CloudWatch Log mgmt (console)` - **Image:**



Descriptive Explanation: "This snapshot from the AWS Console highlights CloudWatch logging execution. In GRC principles, maintaining immutable logs of system executions is required for forensic auditing and incident response."

7. Lambda Execution Role Verification

Snapshot: `Check Lambda function` - **Image:**

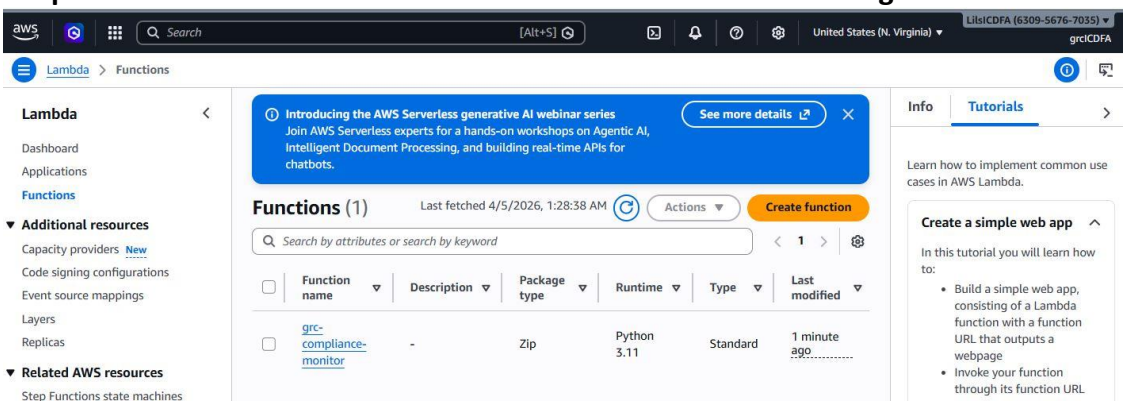


```
PS D:\Documents\icdfa\GRC-AWS CONSOLE-CAPSTONE\GRC208-AWS-Capstone-Project> aws lambda get-function `
>>   --function-name grc-compliance-monitor `
>>   --region us-east-1 `
>>   --query "Configuration.{Name:FunctionName,Runtime:Runtime,State:State}" `
>>   --output table
-----------------------------------------------------
|                   GetFunction                     |
+-------------------------+--------------+---------+
|          Name           |   Runtime    |  State  |
+-------------------------+--------------+---------+
|  grc-compliance-monitor |  python3.11  |  Active |
+-------------------------+--------------+---------+
```

Descriptive Explanation: "This captures the Lambda compliance monitor's successful configuration profile. It verifies that the serverless function was accurately deployed alongside its necessary IAM execution roles."

8. Graphical Lambda Execution Success

Snapshot: `Lambda Function Execution Success Console` - **Image:**



Descriptive Explanation: "Visual verification directly from the AWS Lambda Console, demonstrating the successful graphical execution logs of the testing component without runtime errors or memory timeouts."

9. Config Recorder Initialisation

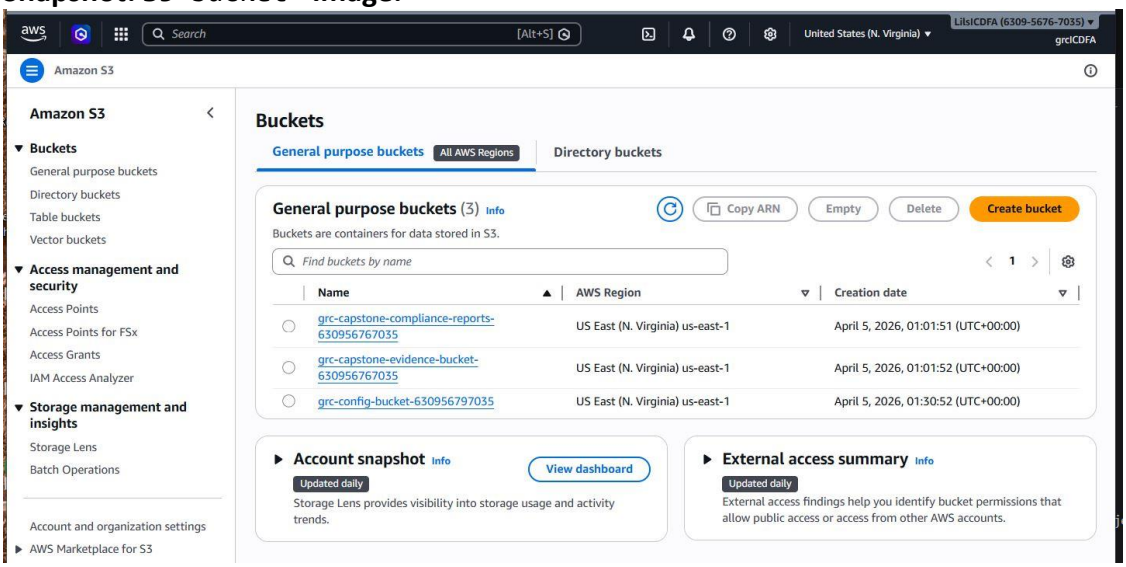
Snapshot: `Check AWS Config recorder` - **Image:**

```
PS D:\Documents\icdfa\GRC-AWS CONSOLE-CAPSTONE\GRC208-AWS-Capstone-Project> aws configservice describe-
configuration-recorder-status `
>>   --region us-east-1 `
>>   --query "ConfigurationRecordersStatus[0].recording"
>>
true
```

Descriptive Explanation: "This snapshot acts as proof that the core AWS Config recorder was successfully enabled and configured to record infrastructure drift, which is pivotal for the automated compliance tracking engine."

10. Centralized Evidence Storage

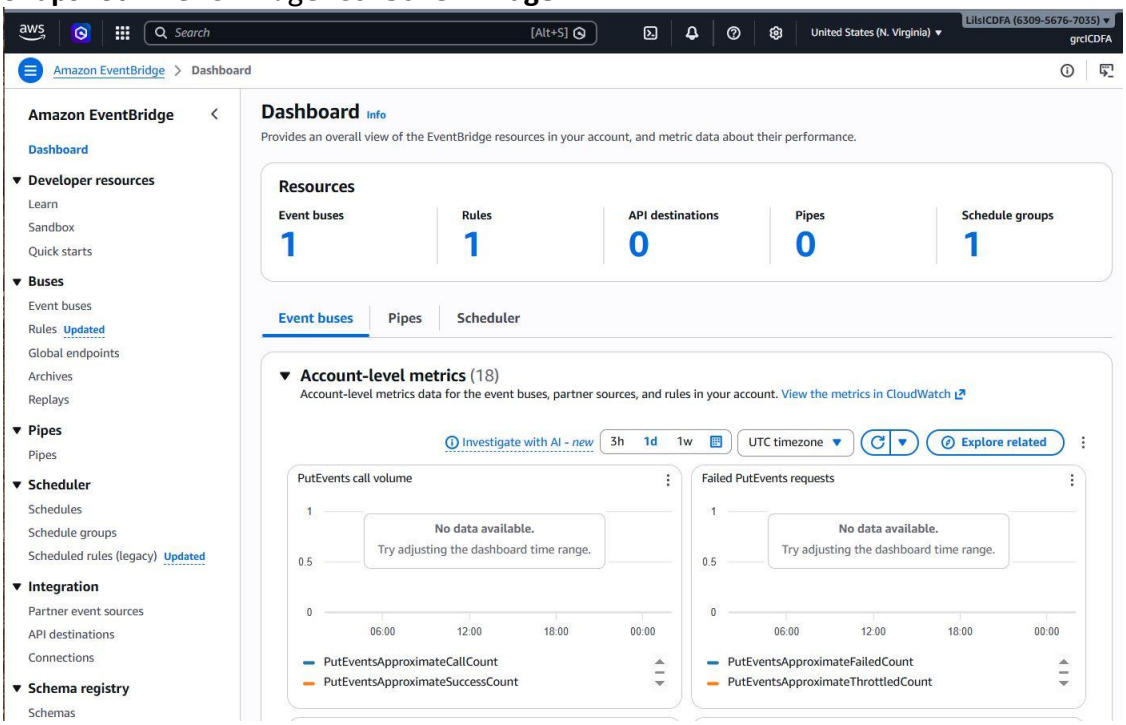
Snapshot: `S3 bucket` - **Image:**



Descriptive Explanation: "A confirmation snapshot showing the successful deployment of the secure S3 bucket acting as the central storage repository for compliance evidence files and Config snapshots."

11. EventBridge Rule Configuration

Snapshot: `EventBridge Console` - **Image:**

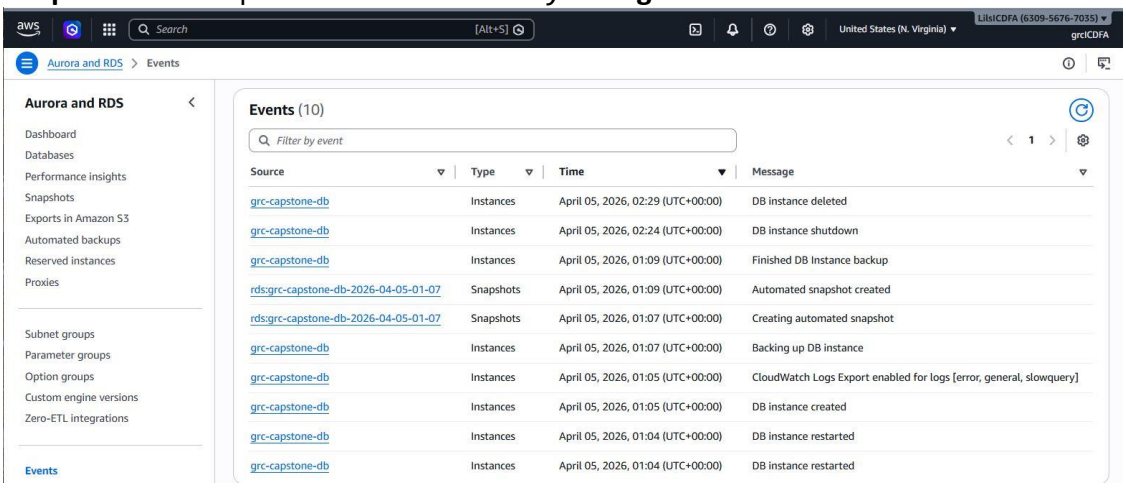


Descriptive Explanation: "A view from the EventBridge Console dashboard providing raw visual

evidence that the automation bus is structurally active and correctly interpreting scheduling metrics.”

12. Database Change Management History

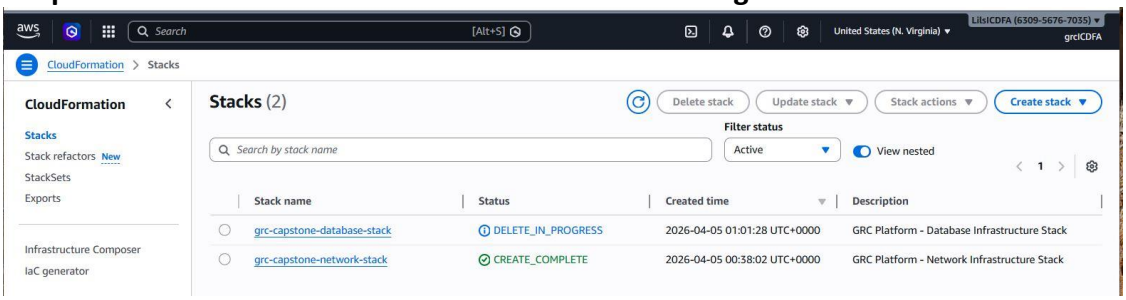
Snapshot: `RDS Implementation History` - **Image:**



Descriptive Explanation: “This snapshot captures the modification and lifecycle history of the RDS database, validating that proper change management controls were audited during the infrastructure’s deployment.”

13. Infrastructure Teardown: Databases

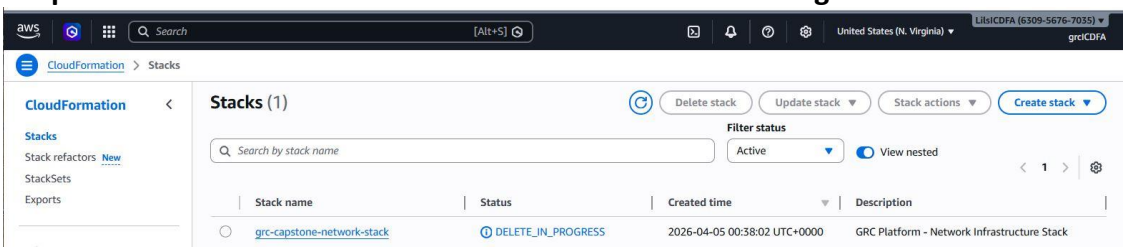
Snapshot: `CloudFormation Database deletion` - **Image:**



Descriptive Explanation: “A critical piece of the project’s financial teardown methodology, capturing the automated dismantling of the RDS database stack to ensure secure data hygiene upon project completion.”

14. Infrastructure Teardown: Networking

Snapshot: `CloudFormation Network Stack deletion` - **Image:**



Descriptive Explanation: "A final snapshot demonstrating the overarching end-of-life process. This verifies the VPC and supporting network subnets were successfully deleted alongside the database to prevent lingering resource costs."
